## SUMMARY

The currently bright demand outlook for cotton and wool is dimmed by growing concern over the future availability of raw fiber supplies. The potentially tight supply developing in the face of strong demand indicates continued large imports of cotton textiles and raw wool. Strong domestic demand for natural fibers reflects recovery in the general economy, expanded textile activity, and keen consumer interest in the "natural" or "soft" look of cotton, wool, and mohair. Demand is also increasing overseas and with more competitive U.S. cotton prices, export prospects are improving. So robust demand, coupled with tightening supplies, have caused cotton prices to rise substantially over the past year.

As a result of these higher prices, farmers have indicated intentions to plant 16 percent more cotton this spring-somewhat below recent expectations. In early April, farmers revealed plans to plant $11 / 4$ million acres of cotton, the same as indicated in January but over 1 million below the $1971-75$ average. However, strengthening cotton prices over the past month indicate that these intentions may be conservative, particularly in Texas where recent rains have brightened planting prospects. The biggest rebound from last year's depressed cotton acreage is planned for the Delta, where intended soybean acreage is down $71 / 2$ percent. Still, rising cotton production costs are limiting the shift to cotton.

The larger acreage planned for the 1976 cotton crop points to production sharply above last year's 8.3 million bales. However, yields will be of crucial importance in determining the exact level of output and thus the
adequacy of $1976 / 77$ supplies. Chances now look good for normal to above-normal yields. Regional acreage shifts should benefit national average yields as the largest increases in cotton acreage are expected in the higheryielding areas of the Cotton Belt. Also, favorable weather has allowed producers to get an early jump on field preparation and planting.

With strong demand foreseen for 1976/77, combined mill use and exports could total as much as 12 million bales if supplies are larger than expected. However, it now appears that the availability of supplies will be a limiting factor and could hold disappearance as low as 10 million bales. Exports may range from $3^{1 / 2}$ to $4^{1 / 2}$ million bales as U.S. cotton moves to fill the gap between foreign cotton consumption and production. Domestic demand offers a potential mill consumption increase in 1976/77 despite continuing stiff competition from manmade fibers. However, tight cotton supplies and large textile imports may undermine this opportunity. U.S. mill use could range from $61 / 2$ to $71 / 2$ million bales, depending on the level of cotton supplies, prices, and textile imports.

The recent dramatic growth in imports of cotton goods is examined in a special article, "The Impact of Cotton Textile Imports on the Domestic Market." Imports will account for nearly a fifth of cotton products sold over American retail counters this spring, up from around 13 percent a year ago-an apparent reduction in 1975/76 U.S. mill use of about 400,000 bales. Most of the increased imports during recent months are
print cloth and sheeting fabrics from the People's Republic of China, with whom we have no textile trade agreements.

Another dominant feature in the near-term outlook for cotton is the carryover situation this summer. With 1975/76 disappearance over 2 million bales above the small 1975 crop, stocks are falling sharply and may approximate $3^{1 / 2}$ million on July 31 . Stocks of the shorter staples (less than 1-1/16 inches) are expected to be extremely tight. Since new crop supplies of these staples generally will not be available in any significant volume until at least December, the supply situation will tighten further this fall.

Prospects for cotton disappearance during the balance of the current season have improved in recent months. Combined mill use and exports during 1975/76 are now placed at about $10^{3 / 4}$ million bales, up 1 million from last year. While mill consumption of around $71 / 4$ million bales is anticipated, a sharp pickup in export sales since midJanuary points to shipments this season of close to $31 / 2$ million.
U.S. textile mills consumed 10.6 billion pounds of fiber in calendar 1975. This was 5 percent below the previous year's level and down 15 percent from the 1973 record. Smaller use last year reflected the impact of the recession early in the year. Cotton's share of total 1975 fiber consumption slipped about 1 percentage point to 28.6 percent. However, in early 1976 , cotton's market share improved to slightly over 30 percent.

This summer's stocks of extra-long staple cotton are expected to fall considerably below stocks on hand at the beginning of $1975 / 76$. The sharply smaller 1975 crop and larger mill consumption are responsible. The season-ending carryover is expected to total 35,000 to 40,000 bales, compared with 59,000 last August.
"Costs and Breakeven Volumes for Universal Density and Modified Flat Bale Presses" is the title of a second
special article. Breakeven volumes for installation of the two presses are developed for different size cotton gins.

The U.S. wool situation is highlighted by a substantial rundown in apparel wool stocks, soaring imports, increasing mill use, and improving raw wool prices.

Commercial stocks of apparel wool totaled about $17^{1 / 2}$ million pounds, clean basis, as of January 1, 1976, down from the year-earlier $411 / 2$ million. The rundown in stocks is due to an increase in mill use and exports of 23 million pounds in 1975 . As a result of the tight supply situation, imports have increased markedly. In the first two months of 1976 , imports totaled 8.6 million pounds, compared with the 1975 total of 17 million. The new domestic wool clip will help relieve some of the pressure on supplies, but tight supplies could exist well beyond 1976 , providing the Australian Wool Corporation does not change its present price and purchase policies for the 1976/77 Australian season.

Apparel wool consumption in 1975, at 94 million pounds, scoured basis, was 19 million above 1974. At current rates of use, mill consumption of apparel wool is expected to be in the 107-112 million pound range in 1976.

Average farm prices of raw wool in February and March, at 53 cents per pound, grease basis, were 55 percent above year-earlier levels. However, the 45 cent per pound average price for 1975 means that participating wool producers will receive payments of $\$ 61$ per $\$ 100$ of 1975 wool receipts. Farm prices are expected to increase from current levels, perhaps averaging in the 6070 cents per pound range in 1976 .

Mohair farm prices reached $\$ 3.40$ per pound, grease basis, in March, double a year earlier. However, the bulk of the spring clip sold under contract at prices ranging from $\$ 2.10$ to $\$ 2.50$ per pound. U.S. prices for the fall clip are expected to be lower. Export demand appears to be slackening as U.S. exports in early 1976 were considerably below a year ago.

The 1976 Supplement to Statistics on Cotton and Related Data, 1920-73, Statistical Bulletin No. 535, published in April 1976, may be obtained from the United States Department of Agriculture, Economic Research Service, Division of Information, Room 0054 South Building, Washington, D.C. 20250.

## COTTON AND WOOL SITUATION

## TEXTILES AND THE ECONOMY

The general economy continues to register steady growth. Real GNP for first quarter 1976 was up $71 / 2$ percent on a seasonally adjusted annual rate. Prospects are favorable for further recovery in 1976. Economic indicators include a slowdown in the inflation rate and rising employment. The annual rate of inflation subsided to 3.7 percent in the first quarter, the lowest rate in $31 / 2$ years. As a result, consumer confidence in the economy has been stimulated as evidenced by strong retail sales in recent months. Gains in real per capita disposable income-expected to rise 4 to 5 percent this year-are bolstering consumer buying power and stepping up retail sales of textile products and other consumer goods. This is important to the U.S. textile industry which depends heavily on the health of the general economy.

So 1976 is shaping up as a much better year than 1975 when the recession caused consumers to cut back sharply on textile purchases early in the year. Domestic
mills consumed only 10.6 billion pounds of fiber last year, 5 percent less than the previous year and 15 percent below the 1973 record. With the exception of wool, all fibers were hit hard as cotton use declined 9 percent to 3 billion pounds and manmade fiber consumption slipped 4 percent to 7.4 billion. Wool use increased 18 percent from 1974's record-low level.

Fiber consumption now has improved considerably from last year's poor showing as textile activity has returned to more normal rates of operation. Despite continued weakness in double knits, the apparel sector is leading the recovery. A recent pickup in auto sales and housing starts also should help spur household and industrial fiber use in coming months. However, increasing textile imports, particularly of cotton goods, are a growing source of concern to the domestic textile industry. (See special article beginning on page 24).

## COTTON SITUATION

## OUTLOOK FOR 1976/77

## Prospective Cotton Plantings

With more competitive cotton prices, vis-a-vis alternative crops, cotton producers plan to seed substantially more acreage to cotton this spring. Based on April 1 intentions, farmers will plant about $11 \frac{1}{4}$ million acres, the same as indicated in January and 16 percent above 1975 plantings. In fact, with improved cotton prices since early April and much needed rain over the High Plains, acreage could easily top the $111 / 4$ million acre level. Current farm prices for cotton are well above the breakeven level for most competing crops. While cotton prices are up 50 percent from last spring, soybean prices are down nearly a fifth, rice prices are down nearly half, corn prices are down slightly, and grain sorghum prices remain about the same. However, rising production costs and relatively high investment and risk are limiting the shift to cotton.

Operating, machinery, and overhead costs of growing cotton in 1976 are expected to increase around 8 percent from last year's $\$ 202$ per acre. However, if 1976 yields are more normal, costs per pound of lint may hold about the same as 1975 's 41 cents, after deducting the
value of cottonseed sold by farmers. By regions, costs also are expected to range near last year's levels-namely 31 cents per pound in the Far West, 43 cents in the Delta, 45 cents in the Southwest, and 57 cents in the Southeast.

Planting intentions for cotton are up in all regions with the biggest rebound from 1975's low plantings in the Delta. Producers in this region indicated in early April that they plan to boost acreage nearly a third to 3.7 million acres, mostly at the expense of soybeans. The same picture holds true in the Southeast where cotton acreage may increase about 29 percent to 1 million acres. In the Southwest, acreage devoted to cotton is expected to total about 5 million acres, up 6 percent from 1975. Cotton acreage intentions in the Far West are up nearly a fifth to around 1.5 million acres (table 1).

Planting is off to an excellent start across the southern tier of the Cotton Belt. An early spring has permitted seeding to near completion in some areas and cotton is up to a good stand in many fields. Elsewhere, field preparation is progressing well ahead of normal.

With the turnaround in cotton prices this year, forward contracting is considerably more active. About 16 percent of U.S. acreage was booked by April 1, more

than was contracted during all of 1975 . By this time last year, only 2 percent of the 1975 crop had been sold forward. Contracting this spring ranges from a low of 4 percent in the Southwest to a high of 30 percent in the Delta. The contracting percentage stands at 25 percent in the Far West and 15 percent in the Southeast.

## Production Prospects

The larger acreage planned for the 1976 cotton crop points to sharply larger production than last year's 8.3 million bales, especially if yields return to more normal levels. As illustrated in figure 1, upland production would total around $101 / 2$ million bales, given normal yields of around 450 pounds per planted acre (bale per harvested acre). Below-average yields of close to last year's 400 pounds per planted acre would result in output of $91 / 2$ million bales. However, a repeat of 1973 's favorable yield of about 500 pounds per planted acre would produce a crop of $111 / 2$ million bales. This year's early spring has enhanced chances for normal to above-normal yields during 1976. Also, regional acreage shifts this year should benefit national average yields as the largest increases in cotton acreage are expected in the higher yielding areas of the Delta. Finally, the law of averages may come into play since 5 of the past 7 years have witnessed below-average U.S. cotton yields. In the Delta, 2 of the last 3 years have been bad.

## Disappearance Prospects

The 1976/77 outlook is for continued strong demand for U.S. cotton here and abroad. Combined mill use and exports may total 10 to 12 million bales. Although prospective 1976/77 demand would support the upper end of this range, it now appears that the availability of supplies will be a limiting factor.

Domestic consumer demand for cotton (including textile imports) is currently running at an annual rate of 8 to $81 / 2$ million bales, the highest level since 1972. Maintenance of demand at this level in the coming marketing year will depend to a large extent on the staying power of recent improvements in general economic activity, as well as on competition from manmade fibers. Currently higher prices for raw cotton could slightly alter the strong demand for cotton products of recent months. In addition, tight supplies could be damaging to U.S. mill use prospects and result in larger cotton textile imports. Competition from these foreign produced textiles may limit U.S. mill consumption of cotton to no more than the middle of our estimated $61 / 2$ to $71 / 2$ million bale range, compared with $71 / 4$ million this season.

A much brighter picture is emerging for 1976/77 U.S. cotton exports. Foreign cotton consumption is expected to increase further next season. Based on current trends, use abroad could total a record 56 to 57 million bales, about 2 percent above this season's level. At the same

Figure 1
time, a March survey of 16 major foreign cotton producing countries by USDA's Foreign Agricultural Service indicates only 5 percent more acreage may be planted to cotton. Although cotton's competitive position is much stronger this year in many foreign countries, there is greater producer inflexibility abroad, partly due to government policy. Given more normal yields, cotton production abroad could increase around a tenth to about 51 million bales. The anticipated shortfall implies a demand for U.S. cotton of more than $4^{\frac{1}{2}}$ million bales. However, the availability of U.S. supplies will largely dictate the exact level of shipments and may limit our exports to $3 \frac{1}{2}$ to $4 \frac{1}{2}$ million bales.

Rising demand in 1976/77 will boost world exports moderately above the 18 million bales or so we expect to be shipped this season. The main question concerns the size of cotton purchases by the People's Republic of China. Although it is likely that her import needs will increase, imports are not expected to match the nearly 2 million bales imported annually in 1972 and 1973.

## Overview

There is real concern that 1976/77 cotton supplies may limit U.S. disappearance next season. In view of the relatively low carryover of $31 / 2$ million bales expected this August, the $11 \frac{1}{4}$ million acre planting intentions certainly leave little cushion to fall back on in the event
yields fall to measure up to normal expectations. Given plantings of $111 / 4$ million acres, it would appear that yields must average well over a bale per harvested acre if we are to avert a very tight cotton supply situation during 1976/77.

## 1975/76 SITUATION

## Supply and Demand Highlights

As the 1975/76 cotton marketing year winds down, it looks as if the carryover will be around $31 / 2$ million bales on July 31, down $2 \frac{1 / 4}{}$ million from last summer. This level is near the bare minimum needed for the transition from old to new crop. The stock reduction reflects disappearance considerably in excess of the small 1975 crop of 8.3 million bales. Combined mill use and exports are placed at about $10^{3 / 4}$ million bales, slightly above earlier expectations, due to strong domestic demand and a sharp pickup in recent export sales (table 22 and figure 2).

The increasing need for U.S. cotton is quickly depleting supplies of shorter staple cotton (less than 1-1/16 inches). Major reasons include continuing robust demand for cotton denim and corduroy (which are made from the shorter staples) as well as recent accelerated export sales of shorter staple cotton for delivery prior to

## COTTON PRODUCTION, USE, AND CARRYOVER

Figure 2

August 1. Based on early-season trends, we could virtually run out of these shorter staples during the next few months. However, a recent narrowing in the price differential between the shorter and longer staples has prompted increased purchases by domestic mills of cotton stapling $1-1 / 16$-inches and longer. Although this substitution will help alleviate the problem, it still appears likely that July 31 stocks of cotton stapling less than 1-1/16 inches will be record low (table 24).

Compounding the tight supply for the shorter staples is the fact that most cotton stapling less than 1-1/16 inches is produced in Texas and Oklahoma. Hence, new supplies will not be forthcoming until at least December and the tight supply situation envisioned on August 1 for the shorter staples will worsen this fall.

## 1975 Crop Totals 8.3 Million Bales

With the exception of the Far West, most cotton producers would just as soon forget 1975. To start with, low cotton prices at planting time served as a disincentive for cotton acreage. Nationwide, producers planted 29 percent less acreage to cotton than a year earlier. Then weather and insect problems, particularly in the Delta and Southeast, held U.S. average yields to the previous year's below-average 441 pounds per harvested acre. As a result, the 1975 crop totaled only 8.3 million bales based on ginnings to early March, 3.2 million below 1974 (table 25).

Shorter staple lengths highlighted the 1975 upland cotton crop. Staples averaged 33.7 thirty-second inches, compared with 34.2 a year earlier. With relatively larger production in Texas and Oklahoma, cotton stapling less than 1 inch accounted for 21 percent of total ginnings, about double the percentage last season, while cotton stapling 1-1/16 inches and longer dropped 11 percentage points to 68 percent (table 2).

The grade index of upland cotton ginnings averaged 91.8 (Middling White $=100$ ), up slightly from $1974 / 75$. Cotton with a micronaire in the desirable 3.5-4.9 range accounted for 69 percent of this season's ginnings, compared with 77 percent last year. However, the average fiber strength of the 1975 crop was up slightly.

## Cotton Prices Average Higher

Farm prices for upland cotton are averaging nearly 50 cents per pound this season, up from 42.7 cents in 1974/75 and the highest in over 100 years. However, with the 28 -percent smaller 1975 crop, the value of production is down about 15 percent to around $\$ 2$ billion. Producers also will receive an estimated $\$ 120$ million in disaster payments, compared with $\$ 128$ million last year. No deficiency payments will be made since the calendar 1975 price of 42.9 cents per pound exceeded the 38 -cent target level.

Cotton prices are also well above loan rates, and as a result, the Commodity Credit Corporation (CCC) is cur-

## ${ }^{1}$ Prelliminary.

Agricultural Marketing Service.
rently holding only about 0.4 million bales under loan. CCC owns virtually no cotton (table 3 ).

Spot market cotton prices have fluctuated undecidedly in recent months. After leveling off at around

57 cents per pound during January and February, the price of SLM 1-1/16-inch cotton dropped moderately, hitting a low of 53.43 cents per pound on March 29. Then the price of this base grade increased to 57.88 cents per pound on April 21. Recent fluctuations primarily reflect the vagaries of demand, particularly for export, as well as supply uncertainties. Large cotton textile imports and a recent weakness in manmade fïber prices also were factors during March. The price differential between the longer and shorter staples has narrowed due to tightening supplies of the shorter staples. In March, SLM 1 -inch cotton was priced at 53.56 cents per pound, only 3.11 cents below SLM 1-1/16 inch. This margin compares with a differential of about 3.40 cents per pound in January and February and nearly 4 cents last November (table 26 and figure 3).

In contrast to the recent fluctuation in spot market cotton prices, futures prices have remained relatively stable. However, prices have increased in recent days as a result of the smaller than expected planting intentions. On April 21, May futures closed at 61 cents per pound while December futures were 60 cents per pound.

## Mill Use May Total About 71/4 Million Bales

U.S. mill consumption of cotton has made a strong recovery from the recent recession. Recent monthly use has been running at an annual rate of close to 7.3 million bales. Given little change in this rate of consumption during the balance of the season, 1975/76 use may total around $71 / 4$ million bales, compared with 5.9 million last

Figure 3
year. Recent stability in the relationship between stocks and unfilled orders of cotton cloth, normally a good indicator of future cotton use, points to continued firmness (table 4).

A broadbased recovery in cotton use is indicated by newly developed data on consumption by end use. As shown in table 27, substantially more cotton is being used in both all-cotton products and blends with manmade fiber. For instance, in the first quarter of 1976, an
estimated 1.2 million bales of cotton were used in the manufacture of cotton broadwoven fabrics. This was up 46 percent from a year earlier, reflecting sharp increases in cotton consumed in denim, corduroy, duck, sheeting, and fine cotton goods. The growing popularity of "natural look" apparel fabrics is spurring use of cotton in these products.

At the same time, use of cotton in blends with polyester is up even more-by 58 percent. Bedsheeting, in

[^1]which the cotton content is about half, accounted for nearly a third of increased cotton use in polyester/ cotton blends.

Among other textile products, increased cotton use over the past year stands out in knit cloth. About 38 percent more cotton was consumed in this important end use in the first quarter than a year earlier.

Domestic demand for cotton products currently is even stronger than that indicated by textile mill consumption. Record cotton textile imports attest to this fact. As discussed in a special article beginning on page 24 , U.S. mills would probably be using $71 / 2$ to 8 million bales of cotton this season were it not for these sharply larger imports.

Cotton also continues to face stiff competition from manmade fibers. However, cotton is holding its own at around 30 percent of the market. In fact, cotton has fared rather well in head to head competition with manmade staple during recent months. For instance, during the initial 7 months of the 1975/76 season, cotton consumption totaled 25 percent above the year-earlier period, compared with increases of 19 percent for noncellulosic staple and 15 percent for rayon and acetate staple (table 5 and 6).

Cotton remains at somewhat of a price disadvantage, vis-a-vis manmade fibers. On a mill-delivered basis, the price of Middling 1-1/16-inch cotton now is around 62
cents per pound. This price converts to nearly 70 cents per pound after adjustment for processing losses, about 15 cents above comparable prices for rayon and polyester staple (table 28). Such a price spread could result in some competitive losses for cotton.

## Total Fiber Use at 5 Year Low; Cotton's Share Off 1 Percent

The recent recession hit U.S. textile mills hard in late 1974 and early 1975. With rising unemployment and rampant inflation, consumers cut back sharply on textile purchases. Per capita fiber consumption dropped about 7 pounds in 1974 and another 3 pounds last year-to slightly below 50 pounds per person. On an aggregate basis, domestic mills consumed 10.6 billion pounds of fiber in 1975, down from 11.1 billion the previous year and a record $12 \frac{1}{2}$ billion in 1973.

Reduced textile activity resulted in a decline of nearly a tenth in cotton use during calendar 1975. Manmade fiber consumption trends were mixed as a 28 percent drop in rayon and acetate use contrasted with a slight gain in noncellulosic consumption. Wool use increased nearly a fifth. Cotton's share of the market totaled 28.6 percent, compared with 29.8 percent in 1974 and 29.3 percent in 1973 (table 29).

However, the quantity of fiber consumed by U.S. textile mills often does not accurately reflect consumer

demand for textile products. Imports and exports of textile manufactures must be considered in the final analysis. By adjusting mill consumption for textile trade, one may obtain a more realistic picture of products being sold over American retail counters.

Imports of cotton textile products in 1975 totaled the equivalent of slightly over a million bales of raw cotton, or 0.5 billion pounds, down only 1 percent from 1974. Imports reached record levels late in the year. On the other hand, U.S. exports of cotton products declined a tenth to 0.7 million equivalent bales, or about 0.35 billion pounds. So 1975's net import textile trade balance increased to 0.3 million bales, a third above the previous year.

There was also a trade deficit for manmade fiber textiles last year. Imports of 0.4 billion raw fiber equivalent pounds topped exports by a fourth (tables 30 and 31 ).

Adding the fiber equivalent of textile imports to U.S. mill use of fibers and subtracting textile exports gives actual domestic consumption. On this basis, total fiber use in 1975 amounted to 10.85 billion pounds, 4 percent below 1974. Hence, the average U.S. consumer used the equivalent of 51 pounds of fiber, nearly a tenth of which was from foreign mills (figure 4).

Per capita domestic cotton use last year dropped slightly over 1 pound to 14.9 pounds. Manmade fiber use also declined slightly over 1 pound per person. As in the case of U.S. mill consumption, cotton's share of the domestic fiber market slipped about 1 percent to 29.2 percent (table 29).

## Export Sales Up; Shipments May Total 3 $1 / 2$ Million Bales

U.S. cotton export prospects for 1975/76 are looking up as somewhat limited competitive supplies abroad and more competitive U.S. prices are boosting sales. Net new sales for 1975/76 delivery have amounted to close to 1 million bales since mid-January. This spurt has lifted our net export commitment for this season to 3.4 million ( 480 pound) bales. With additional export sales likely in coming months, $1975 / 76$ shipments may total around $31 / 2$ million bales, compared with 3.9 million last year.

While U.S. cotton prices in world markets have stabilized in recent months, foreign prices have increased, thus narrowing the price disadvantage which confronted U.S. cotton early in the season. For instance, in midApril, the price of U.S. SM 1-1/16-inch cotton (Memphis Territory) averaged nearly 70.00 cents per pound, about 4 cents above the Northern Europe Outlook "A" Index, which is an average of the five cheapest growths offered for sale. The price differential was around 10 cents per pound during August-December (tables 7 and 33 ). The price differential for California/Arizona cotton is even less, averaging 2 to 3 cents per pound in recent weeks.
U.S. exports during the first 8 months of 1975/76 totaled 2.1 million bales, about 12 percent below the year-earlier level. However, shipments are expected to pick up sharply during the balance of the season, reflecting the large sales made since mid-January (figure 5).

Tightening foreign cotton supplies this season are aiding U.S. exports. Foreign production is down 6 million

Compiled from Foreign Agricultural Service records.
bales to 47.1 million. At the same time, cotton consumption abroad is up about 2 million bales to 55.5 million. This shortfall of over 8 million bales is being
covered by U.S. exports and relatively large beginning stocks in foreign countries. Stocks abroad at the end of this season will likely total about 20 million balesenough cotton to keep foreign mills operating for a little over 4 months. Normally, a 5 to 6 month carryover is considered desirable (table 34).

World cotton trade this season is placed at around 18 million bales, up from 16.9 million in $1974 / 75$. With reduced demand for U.S. cotton earlier this year, our share during $1975 / 76$ may fall to about 19 percent from last season's 23 percent (figure 6).

About a third of our early-season exports were shipped to South Korea. Japan, normally our major customer, and Taiwan each accounted for nearly a fifth of our exports during August-February (table 35).

## Extra-Long Staple Cotton

This summer's stocks of extra-long staple (ELS) cotton are expected to fall considerably below stocks on hand last August. The sharply smaller 1975 crop and larger mill consumption are responsible. The seasonending carryover may total 35,000 to 40,000 bales, compared with 59,000 last August (table 22).

Based on the March 19 ginnings report, the 1975 crop totaled 54,400 ( 480 pound) bales, down from 90,200 last year. The big drop resulted from lower yields on reduced acreage. So even with slightly higher beginning stocks and much larger imports, the $1975 / 76$ supply of about 143,000 bales is down slightly from last year.

## U.S. COTTON EXPORTS AND PRICES

[^3]

Figure 6

As with upland cotton, mill consumption of ELS cotton is recovering strongly this season from the depressed year-earlier level. Use may total around 80,000 bales during 1975/76, up a fourth from last year. However, exports may not quite match $1974 / 75$ 's 12,000 bales.

With disappearance far in excess of the small 1975 crop and stocks falling, ELS prices are up sharply this season. Farm prices have averaged about 80 cents per pound during recent months, compared with 64 cents
received for the 1974 crop. The loan rate for the 1975 crop is 67.74 cents per pound, up from 49.72 cents in 1974. However, the direct payment, at 6.36 cents per pound, is down from last year's 10.86 cents.

Based on April 1 planting intentions, ELS cotton producers plan to plant 66,000 acres to the 1976 crop, slightly below last year's 67,800 acres. The national average loan rate for the new crop is 73.24 cents per pound and the payment rate is 1.51 cents.

WOOL SITUATION

## U.S. SITUATION

## Raw Wool Imports Increasing

Imports of apparel wool in January and February, at 8.6 million pounds, clean basis, were 72 percent above the November-December total and more than four times year-earlier imports. The increase is due to the low wool stocks in the U.S. and a higher rate of mill use. The January import figure was the highest monthly total since September 1971. Of the 8.6 million pounds imported, 6.4 million were from Australia.

Total raw wool imports during 1975 were about 25 percent larger than in 1974. Apparel wool imports were
up by 41 percent and carpet wool imports by 12 percent (tables 8 and 9 ). Imports of grades finer than 58 's rose sharply with the Australian share about 85 percent. Whereas total imports increased about a fourth in 1975, imports from Australia almost doubled as they approached 12 million pounds. Wool in the Australian Wool Corporation (AWC) stockpile in the U.S. is not recorded as a duty-paid import until the duty is paid.

With U.S. wool production continuing to decline and wth the downward trend in domestic mill use at least interrupted for the time being, a growing dependence on imported wool is indicated. Stock sheep numbers are down about 8 percent from 1975 indicating a decline of 9 to 10 million pounds in shorn wool production, grease

basis, this year. To maintain reasonable levels of both stocks and mill usage, imports must increase significantly over the levels of recent years. However, the absolute level is contingent upon the AWC's price and purchase policies for the 1976/77 season. These policy decisions are expected to be announced before June 30 . With the new domestic clip now arriving, pressure on domestic raw wool supplies will be relieved somewhat with a decline from the rate at which wool was imported in the first two months of the year.

## Apparel Wool Mill Activity Remains Strong

Domestic mill consumption of apparel wool was 26 percent larger in 1975 than in 1974 while carpet wool consumption was 14 percent lower (table 10 ). Total mill use increased to about 110 million pounds, scoured, up 18 percent. Consumption of apparel wool on the worsted system accounted for 56 percent of total apparel wool consumption as it did in 1975. Consumption on the worsted system increased about 11 million pounds above 1974 or 26 percent. Consumption on the woolen system increased 8 million pounds or 24 percent. The percentage of apparel wool grading 60 's and finer continued to increase in 1975, accounting for 53 percent of total consumption, up about 7 percent from 1974 and 10 percent above 1970. Apparel wool grading 60 's and finer accounted for 38 percent of woolen system consumption in 1975 and 64 percent of worsted system use (table 11).

${ }^{1}$ Preliminary.
Compiled from reports of the Bureau of the Census.

Consumption on the worsted system in the first 2 months of 1976 ( 8 weeks) totaled 9 million pounds, about the same as the last 2 months of 1975 ( 9 weeks) but well above the year-earlier total of 6.2 million ( 9 weeks). Consumption on the woolen system totaled 8.6 million pounds in the January-February period compared with 8.1 million in November-December and 6 million a year earlier. Total apparel wool consumption in January-February averaged about 2.2 million pounds per week, compared with 1.9 million in NovemberDecember and 1.4 million a year earlier.

On a seasonally adjusted basis, the average weekly rate of apparel wool consumption has held steady for the past 6 months (through February 1976), varying between $2,052,000$ and $2,154,000$ pounds, a range of only 102,000 pounds. The average rate of mill consump-

Compiled from reports of the Bureau of the Census.
tion per week over the past 6 months indicates that apparel wool consumption in 1976 will likely total around 110 million pounds. The minimum and maximum weekly rates above indicate a range of 107 to 112 million pounds of apparel wool mill use in 1976 (table 36).

An additional indication that annual wool consumption has leveled near the 110 million pound level for 1976 is that the ratio of stocks to unfilled orders for finished wool apparel fabrics leveled off in the fourth quarter of 1975 after declining steadily for about a year. In December 1975 the ratio stood at 26 percent, compared with 97 percent at the beginning of 1975 (table 12).

## Outlook for Apparel Wool Consumption

The renewed interest in wool is due mainly to a swing in fashion trends to the "natural" or "soft" look. The increase in mill consumption relates to increased production of woven woolen and wool blend fabrics used in the

| December | 38 | 35 | 93 | 26 |

construction of women and men's heavy outerwear and sportswear. A limited recovery has occurred in the production of worsted fabrics but activity in the worsted sector remains at historically low levels. Wool fiber use on the woolen system in 1975 virtually equalled the 1973 level, but consumption on the worsted system was about 22 percent below 1973 .

Higher oil prices have also aided wool's recent gains by making manmade fibers and products more expensive. However, wool is still more expensive than most of the manmade fibers and is likely to remain so due to the higher costs of converting raw wool into fabric. At any rate the decline in wool prices since 1973 and the rise in synthetic fiber prices in 1975 made wool more competitive. In fact, wool's share of the fibers consumed in woolen and worsted mills for uses other than carpet and rug yarns increased from 24 percent in 1974 to 30 percent in 1975, while manmade fibers' share dropped from 59 percent to 55 percent. Total fibers consumed (excluding carpet) was virtually unchanged from 1974 to 1975 , but consumption in 1975 was 15 percent below the 1973 level (table 37 and figure 7).

In short, the outlook for domestic apparel wool use is decidedly optimistic for 1976 and until the fashion pendulum swings in a different direction. The key factor in the resurgence in apparel wool demand appears to be that wool possesses the fiber properties required by current style trends. In the long-run, however, economic factors such as fiber price levels and price variability, processing costs, and supply availability will largely determine the outcome of the interfiber competition in the U.S. As of now, manmade fibers have the advantage over wool with respect to the economic factors and if domestic shorn wool production continues to slide, forcing mills to turn increasingly to foreign wools, their advantage is likely to widen.

## Carpet Wool Use Remains Slow

Consumption of carpet class wool dropped to 16 mil lion pounds in 1975 , down 15 percent from 1974 and

## WOOL MILL FIBER USE

more than 60 percent below 1973 (table 10). The carpet industry has experienced 2 very poor years since the high level of activity in 1973. U.S. mill shipments of carpets and rugs in 1975 fell 11 percent below 1974 and were 18 percent under 1973 shipments. However, shipments in the fourth quarter of 1975 were 13 percent above year-earlier levels (table 13), and industry officials are expecting an increase of 10 to 15 percent in carpet fiber shipments in 1976. Single-family housing starts, a good indicator of future carpet demand, at the beginning of the year were about 18 percent above year-earlier levels.

Complled from reports of the Bureau of the Census.

Wool continues to be displaced by the manmade fibers in carpet and rug production. Wool's share of carpet class fibers consumed in woolen mills declined further in 1974 and 1975 to about 9 percent, compared with 16 percent in 1973 and 29 percent in 1971 and 1972 (table 37). Carpet wool consumption will likely increase in 1976 to $17-18$ million pounds. However, wool's share of the market will fall in 1976 as well as in the years ahead.

## Commercial Stocks At Historically Low Levels

Apparel wool trade stocks as of January 1, 1976, at an estimated 17.5 million pounds, clean basis, were down about 60 percent from the year-earlier 41.5 million. These stocks do not include wool held by or for the account of growers but they do include stocks held on consignment and in the process of manufacture up to the carding operation. The rundown in stocks was caused by an increase in mill use and exports of about

23 million pounds from 1974. As a result of the tight supply situation, imports have increased markedly and exports have slowed considerably. In January-February 1976, U.S. raw wool exports totaled 150,000 pounds, clean basis, compared with the year-earlier total of 470,000 . The new clip now arriving on the scene will relieve some of the pressure on supplies, but unless massive restocking occurs via imports, tight supplies will exist well beyond 1976.

Commercial stocks of carpet wool as of January 1, 1976, were about 10 million pounds, clean basis, up about 15 percent from a year earlier. At present rates of mill use these stocks appear adequate. However, as mill use picks up, imports must increase to maintain normal stock levels since carpet class wool is not produced in this country.

## Raw Wool Prices to Advance

Average farm prices for shorm wool, grease basis, at 53 cents per pound in February and March, were 55 percent above year-earlier levels. The fall in farm prices beginning in early 1973 was checked in mid-1975 and since then prices have generally trended upward (table 14). However, the 1975 average farm price fell to 45 cents per pound, down 14 cents from 1974 and far below the 72 cents per pound incentive price set by the National Wool Act. Producers will receive payments of $\$ 61$ per $\$ 100$ of wool sales receipts on 1975 marketings. A payment rate of $\$ 1.09$ per hundredweight on unshorn lambs sold in 1975 has also been announced.

${ }^{1}$ Preliminary.
Crop Reporting Board, SRS.

Farm prices are expected to increase from current levels as new clip supplies become available in volume. In view of the current imbalance in the domestic supply/ demand situation, farm prices for the year may well average in the 60 to 70 cents per pound range.

Domestic fine wool prices at U.S. mills averaged about $\$ 1.76$ per pound, clean basis, in the first quarter of 1976 , up 62 cents or 54 percent from a year ago. After rising sharply in mid-1975, domestic fine wool prices have shown little variation over the past 6 months due to the lack of market activity. Foreign fine wool prices have shown great stability over the last 15 months. In the first quarter of 1976, foreign (Australian) fine wool delivered to U.S. mills averaged $\$ 2.06$ per pound, duty-paid, scarcely different from that of a year earlier. The spread between domestic and foreign fine wool prices including the duty ( 25.5 cents per clean pound) is now around 30 cents per pound compared with a spread of 90 cents in early 1975 (tables 38 and 39 and figure 8). The spread has narrowed primarily because the U.S. economy has improved relative to the European and Japanese economies. Also, our dollar has gradually strengthened relative to the Australian dollarresulting in Australian wool prices declining in terms of U.S. dollars. The wide spread in early 1975 greatly stimulated raw wool exports. These exports contributed to the tight supply situation and price increases in the second half of the year.

Domestic and foreign medium wool prices have followed similar trends (figure 8), but the price spread exceeds that for the finer wools and is much greater in percentage terms. Foreign, duty-paid, medium wools in first-quarter 1976 averaged about 42 percent above domestic prices, compared with a 17 percent difference in fine wool prices.

## Longer-Term Price Outlook

Domestic wool prices are heavily dependent upon the policies of the Australian Government with respect to its support price and stock disposal activities. The AWC is able to moderate downward price movements by its purchases and to limit price increases by selling its stocks. During the 1974/75 Australian season, the AWC purchased about one-third of the offerings at auction to maintain the floor price for 21 micron wool at 250 Australian cents per kilogram (U.S. $\$ 1.42$ per pound). As a result, the AWC stockpile at the end of the season totaled 1.6 million bales compared with 176,000 a year earlier. The 250 cents per kilogram support price was maintained for the 1975/76 season beginning in August 1975 and by mid-November the AWC stockpile reached 1.9 million bales. The stockpile has since been reduced somewhat but the AWC has to decide this summer on its support activities for the 1976/77 season. The indication at this time is that the current floor price will be maintained. Even so, a move by the AWC to dispose of its stockpile cannot be ruled out. If such a move were to occur, the effect on U.S. prices would be cushioned somewhat by the import tariff but a downward pressure would definitely be exerted in the second half of 1976. Needless to say, the outlook for domestic wool prices will be greatly clarified when AWC policies for the 1976/ 77 season are announced.

Movements in manmade fiber prices will also have an affect on wool prices. If the fiber producers carry out their announced production expansions, the prices of these fibers are likely to increase only gradually unless some fundamental change in the raw material price making forces occurs, such as in OPEC oil policy. Manmade fiber prices are not likely to decline due to the general inflationary trend in raw material prices, and if recenthistory is an indicator of future marketing strategy, fiber producers are likely to curtail output rather than reduce prices in times of falling demand. If manmade fiber prices increase only gradually, as expected, increases in wool prices will be moderated to some extent.

Movements in the exchange rate between the U.S. and Australian dollars also affect domestic wool prices. There was much discussion in 1975 about the possibility of an official devaluation of the Australian dollar-which would lower the import price of Australian wool. Rumors of the devaluation have been largely dispelled but the Australian dollar continues to slide ever so slowly against the U.S. dollar. This slide accounts for some of the narrowing in the spread between imported and domestic wool prices over the past year.

## Textile Trade and Production Picking Up

U.S. imports of wool textile products declined 8 percent in 1975 to 68 million pounds raw wool content. However, in the fourth quarter of 1975 and the first 2 months of 1976 , they ran at an annual rate of 85 million pounds. Exports of wool textiles fell 18 percent in 1975 to 21 million pounds and are currently running at about 17 million on an annual basis (tables 40 and 41 and figure 9 ).

Exports of wool tops fell to 11 million pounds in 1975 compared with 13 million in 1974 and 23 million in 1973. In January-February 1976, top exports totaled 630,000 pounds compared with 1.4 million a year earlier (table 42).

The net import balance of wool textiles declined slightly in 1975 to 47 million pounds compared with 48 million in 1974 and 57 million in 1973. In the 1973-75 period, the net import balance averaged about 46 percent of U.S. raw wool mill consumption as opposed to about 30 percent for earlier years. The net import balance is likely to increase to about 55 percent in 1976 , or to 60 to 65 million pounds.

In 1975, domestic woven wool fabric production declined 4 percent but a 25 -percent increase was noted in the fourth quarter reflecting earlier increases in consumption at the spinning stage. Wool blanketing fabrics increased 10 percent from 1974 and upholstery fabrics increased 14 percent.

Figure 9
bales in excess of 180 kilograms (about 400 pounds). Later, new disagreements were added over wage rates and working hours. The strikers have agreed to return to work but it is expected to be two months before marketing operations return to normal. Sources indicate that as of early April shipment of nearly 530,000 bales had been held up. In addition, auctions were cancelled. Spot shortages of wool are reported and many Japanese mills are said to be in a crucial supply situation.

## World Outlook

The outlook for wool is tied to the prospects for a recovery in economic and textile activity in the industrialized nations. At the present time, economic growth in Japan and the European countries is lagging well behind that of the United States. However, a pickup in
economic activity is expected in 1976 as a result of the institution of expansionary economic policies in most of the major industrial nations. Additionally, the recovery in the United States will be partially transmitted to other nations through its impact on international trade.

During the recession, raw wool purchases in the main wool manufacturing countries declined much more than consumption of finished wool products. As a result, the level of raw and semi-processed wool stocks fell considerably. Due to the extent of the rundown in stocks, any revival in economic activity will be felt quickly at the mill level. Table 43 presents the latest available data on world textile activity.

Although world wool production was virtually unchanged in 1975, stocks of raw wool in Australia, New Zealand, and South Africa increased considerably. The existence of these large stockpiles of wool will tend to limit price increases generated by a boost in demand.

## MOHAIR SITUATION

Farm prices of mohair continued to advance in March, reaching $\$ 3.40$ per pound, grease basis, up 50 cents from February and $\$ 1.70$ from March 1975. Trade sources indicate, however, that about half the spring clip
has been sold under contract at prices ranging from $\$ 2.12$ to $\$ 2.50$ per pound. Kid hair, about one-third of the spring clip, sold at prices ranging from $\$ 2.85$ to $\$ 4.00$ per pound. Only a small portion of the spring clip
remains unsold. Indications are for a decrease in price for the fall clip of 50 cents per pound or more from this spring's level. Foreign mohair prices are also declining. The last three sales in South Africa have resulted in successively lower prices.
U.S. exports of mohair in 1975 totaled 8.8 million pounds, compared with 7.4 million in 1974. In the first 2 months of 1976 , exports totaled 460,000 pounds,
down considerably from the 1.1 million recorded a year earlier (table 41).

The 1975 Texas mohair production totaled 8.6 million pounds, up 2 percent from 1974. The number of goats clipped totaled 1.2 million head, 3 percent above 1974. Production in 1976 is expected to top that in 1975 by 3 to 6 percent.

# THE IMPACT OF COTTON TEXTILE IMPORTS ON THE DOMESTIC MARKET 

by<br>Russell G. Barlowe and John V. Lawler<br>Commodity Economics Division<br>Economic Research Service

#### Abstract

This study examines the recent dramatic growth in cotton textile imports, which now account for nearly a fifth of domestic cotton consumption. The impact on U.S. mill consumption of cotton is analyzed. Also, products mainly responsible for the recent growth in overall imports are pinpointed along with countries of origin.

KEYWORDS: Cotton textile imports, import penetration, domestic consumption, sheeting, and print cloth.

## INTRODUCTION

U.S. imports of cotton goods, long an important component of domestic textile use, have taken on even greater significance in recent months. Imports will account for nearly a fifth of cotton products sold over retail counters this spring, up from around 13 percent a year ago and less than a tenth in 1965. This article analyzes this recent spurt in domestic demand for foreignproduced textiles, including the principal products involved, their countries of origin, and the impact on U.S. mill consumption of cotton.

Increasing cotton textile imports during the past year are directly tied to the recovery from the recent recession in textile activity in this country, demand for the natural look of 100 -percent cotton fabrics, abundant supplies of cheaper foreign textiles, and somewhat limited domestic flexibility for manufacturing all-cotton products, particularly coarse yarn goods. The decline in the cotton broadwoven goods industry over the past 10 years reflects increased consumer demand for easy care fabric blends, coupled with more stable manmade fiber supplies and prices. This big shift to blends has sharply curtailed the desire of domestic textile mills to produce 100 -percent cotton fabric. For instance, production of 65 -percent polyester/35-percent cotton blends has more than tripled over the past decade, aided by sizeable manmade fiber industry promotional expenditures. However, a slightly different trend is now evident-increased demand for the casual look and feel of all-cotton prod-
ucts and higher cotton-content blends. There is also greater consumer dissatisfaction with synthetic double knits. Consequently, with this recent renewal in demand for cotton products, U.S. apparel and other textile product manufacturers have turned to foreign fabric suppliers, whose goods historically have been priced below U.S. products. Imports have gained despite the bilateral textile agreements which we maintain with a number of foreign countries.

## TEXTILE TRADE AGREEMENTS

Several agreements have been negotiated during recent years to regulate international trade in textiles. Under the 1962 Long-term Textile Agreement, U.S. imports of cotton textiles could be restricted when domestic markets were threatened or subjected to disruption. However, certain provisions, such as a 5 -percent annual growth factor and reciprocal agreements, provided for increased imports.

The Long-term Textile Agreement was replaced in January 1974 with the Arrangement Regarding International Trade in Textiles, or the Multifiber Arrangement (MFA), negotiated under the General Agreement on Tariffs and Trade (GATT). The MFA includes cotton, wool, and manmade fiber textiles and will expire at the end of 1977: Under the MFA, bilateral agreements are permitted to eliminate risks of textile market disruption in importing countries while ensuring the expansion and
orderly development of world trade. Section 204 of the Agricultural Act of 1956 empowers the United States to negotiate such arrangements. Currently, we have bilateral agreements with 18 countries.

Our most notable bilateral textile agreements are with Japan, South Korea, Hong Kong, and Taiwan. These 3 year multifiber agreements became effective in October 1974. As a result of shrinking exports to the United States in recent years, the Japanese agreement was recently amended to remove restraint levels on exports of cotton and manmade fiber textiles to the United States and establish a consultation/negotiation mechanism to handle market disruption complaints. The agreement with South Korea permits annual increases of 6.25 percent to 6.75 percent in their exports of specified items. Both the agreements with Hong Kong and Taiwan permit an overall 6.25 percent annual increase in exports to the United States.

Many of these countries have not been fully utilizing their quotas during recent years. So with ceilings increasing each year, U.S. imports of cotton textiles have been allowed to increase very sharply over the past year. There have also been sharply expanded shipments from non-quota countries, especially the People's Republic of China.

## IMPORT PENETRATION

After increasing sharply in the early 1960 's, imports of cotton textile products leveled off at around 1 million equivalent bales of cotton in the late 1960's and early 1970 's. By comparison, exports of cotton textiles from the United States averaged about 0.5 million equivalent bales during this period (tables 15 and 16). The result was a net import textile trade balance of about 0.5 million bales annually (figure 10). However, the import balance has increased to an annual rate of about 0.8 million equivalent bales during recent months, reflecting larger imports and stable exports.

Perhaps the best measure of U.S. retail demand for cotton goods is domestic cotton consumption. This statistical series is obtained by adding the raw cotton equivalent of textile imports to the raw cotton consumed by U.S. mills and then subtracting the raw cotton equivalent of textile exports. As shown in figure 11, domestic cotton use declined about $31 / 2$ million bales between 1965 and 1975 , reflecting both competitive losses to manmade fibers and relatively larger cotton textile imports. The share of the U.S. market garnered by imports jumped from 7.7 percent to 15.7 percent during the past decade. However, the annual data for 1975 mask the

## DOMESTIC COTTON CONSUMPTION AND COTTON TEXTILE IMPORT SHARE*

MIL. LB.

* domestic cotton consumption is u.s. mill consumption, plus the raw fiber equivalent of imported TEXTILES, LESS THE RAWFIBER EQUIVALENT OF EXPORTED TEXTILES. MONTHLY DATA ARE ON A SEASONALLY ADJUSTED ANNUAL RATE BASIS. (FIGURES ON IMPORT BAR REPRESENT PERCENT OF TOTAL.)

Figure 11
turnaround in demand for cotton products which got under way early in the year. They also hide the sharp import penetration late in 1975. Consequently, monthly data for 1975 and early 1976 are also shown in figure 11. These data reveal the extremely sharp recovery in cotton demand and show domestic cotton use during recent months well over 8 million bales on a seasonally adjusted annual basis. And even more important for the purposes of this study, an import penetration of close to
one-fifth of the domestic market is revealed for recent months. During December-February, cotton textiles were imported into this country at a record annual rate of 1.6 million equivalent bales.

The doubling of cotton textile imports during the past year reflects a 69-percent gain in shipments of manufactured products (primarily wearing apparel) and a 148-percent increase in imported semi-manufactured goods (primarily cloth). Cotton cloth imports have
accounted for virtually the entire increase in overall shipments since mid-1975.

## COTTON CLOTH IMPORTS

The primary cotton fabrics imported into the United States are duck, poplin, print cloth, sheeting, sateens, and twills. As shown in table 17, print cloth and sheeting
imports have increased sharply over the past 8 months and account for most of the increase in cloth shipments. Imports of these two types of fabric during DecemberFebruary averaged 15 million raw cotton equivalent pounds, more than 3 times last July's level.

Imports of cotton sheeting have increased dramatically over tha past decade. In 1975, these imports accounted for about a third of the domestic market for sheeting fabric, up from a tenth in 1965 (figure 12). The

## IMPORT SHARE OF DOMESTIC CONSUMPTION

USDA
NEG. ERS 2437.76 (4)
Figure 12
import penetration reached 43 percent in the fourth quarter of last year. U.S. production of 100 -percent cotton sheeting has fallen off by over half in recent years, reflecting a substantial shift in looms to blended fabric.

Likewise, cotton print cloth imports are capturing a larger share of the domestic market. The import penetration in 1975 averaged 16 percent, compared to only 3 percent in 1965 (figure 12). In the fourth quarter of 1975, imports accounted for 35 percent of the domestic print cloth market.

The People's Republic of China (PRC) currently is the largest supplier of imported print cloth (figure 13).

Figure 13
However, shipments have leveled off in recent months after increasing sharply last fall. Other significant countries of origin include Pakistan, South Korea, India, and Brazil.

The PRC also is one of the leading foreign sources for sheeting imports. Shipments from this non-quota country have jumped sharply since mid-1975. Imports from other countries, notably Taiwan, Hong Kong, and Pakistan, have also trended up during this period (figure 14).

Recent sheeting and print cloth imports from the PRC have been competitively priced, both with U.S. imports from other countries and with domestically produced fabric. However, this situation is in marked

Figure 14
contrast to the cheaper imports of earlier years and may foreshadow some cutback in imports in coming months.

## DOMESTIC IMPACT

Increasing cotton textile imports have substituted for potential U.S. mill consumption of raw cotton. Consumer demand today for cotton products, as measured by domestic consumption, is at the highest level since 1972 when 8.7 million equivalent bales of raw cotton were used and imports accounted for less than 15 percent of the market. However, imports are now capturing close to 20 percent of the domestic market and monthly U.S. mill consumption is running at an annual rate of around 7.3 million bales. This translates into an apparent reduction in mill use of about 400,000 bales, most of which has occurred since mid-1975. In other words, 1975/76 U.S. mill consumption would total closer to 7.7 million bales if today's import share approximated that which occurred between 1972 and mid-1975. Of course this observation assumes that domestic textile mills had the ability and incentive to increase production. It should also be pointed out that much of the raw cotton used to make textile products imported into this country was originally produced on U.S. cotton farms.

The level of U.S. cotton textile imports during the balance of 1976 will depend on several factors. Domestic demand at the consumer level will be a key variable. But perhaps just as important will be the price competitiveness of domestic and foreign-produced textile products. Although foreign goods have maintained their price advantage over U.S. products during recent years, the price differential has narrowed significantly in recent months. This situation indicates that buyers of cotton fabrics will switch from imports to domestically produced fabrics later this year if supplies are available and if prices for imports continue to rise. The slight decline in February textile imports may reflect such a switch.

On the other side of the coin, U.S. supplies of raw cotton promise to tighten considerably in coming months. As a result, the availability of Americanproduced cotton products may not be adequate to satisfy consumer demand, thus resulting in an increased need for foreign textiles.

The net result of this situation surrounding prices and supplies of textile products may first be a decline in U.S. imports during the next few months because of more competitively priced U.S. produced goods, followed by increased demand by the end of the year as U.S. supplies shrink.

#### Abstract

Breakeven volumes for installation of a universal density press versus a modified flat bale press were developed for $8,12,16,20$, and 24 bale per hour gins. The breakeven point ranged from 3,850 bales at 12 bale per hour gins to 5,117 bales at 24 bale per hour gins. An equation, enabling an individual gin owner or manager to substitute his own specific data and calculate breakeven volumes for his ginning operation is presented.

KEYWORDS: Cotton, gins, density, breakeven volumes.

## INTRODUCTION

The development and recent acceptance of the Universal density (UD) cotton bale by all segments of the cotton industry have caused many gin operators to consider making substantial changes in their pressing operations. With UD compression of bales at the gin to approximately 28 pounds per cubic foot, no further compression is required in subsequent stages in the marketing system, including bales for export. Traditionally, bales are pressed to a density of about 12 to 14 pounds per cubic foot (modified flat press) at the gin and then further pressed to a higher density at compress facilities.

The modified flat (MF) bale press is essentially a regular flat bale gin press that has been modified by lining the press box with wood to reduce the bale width to accomodate the necessary bale dimension for UD compression later in the marketing system. Any new baling installation should involve either the UD or the MF bale press to accomodate today's marketing needs. A bale of cotton initially compressed to a universal density at the cotton gin offers many potential savings and benefits in handling, compressing, and storage to the cotton industry. UD compression, however, requires a greater capital investment by the gin in addition to other financial considerations. In most areas, an allowance or rebate is paid to the ginner by the cotton warehouse for delivery of UD bales for storage. The amount of this allowance, usually about $\$ 3$ per bale, is eventually passed on to the
buyer of the cotton as a compression charge when the bale is removed from storage and shipped.

Gin operators, when considering installation of a UD press in a new gin instead of a new MF bale press or replacing an older flat bale press in an existing plant, must compare the additional costs of owning the UD press with the potential savings in operation and the additional revenue (rebates) resulting from its installation and use. This article describes the cost relationships and computational procedures necessary to enable gin operators to make these economic determinations regarding their operation. ${ }^{1}$

## DETERMINING THE TYPE OF PRESS TO INSTALL IN NEW GINS

In considering the installation of either a UD press or a MF bale press, there is an annual volume of bales pressed short of which installation of the MF press is advisable and beyond which the added investment for a UD press is justified. This point is the volume at which the total compression costs using either type of press is the same. This indifference point, or breakeven volume,

[^5]for a given size gin can be determined by using the following equation and cost relationships:
$\operatorname{Pct}\left(\mathrm{I}_{\mathrm{UD}}-\mathrm{I}_{\mathrm{MF}}\right)+\left(\mathrm{P}_{\mathrm{UD}}-\mathrm{P}_{\mathrm{MF}}\right)(\mathrm{X})+\left(\mathrm{Rv}_{\mathrm{UD}}-\mathrm{Rv}_{\mathrm{MF}}\right)$ $(\mathrm{X})+\left(\mathrm{Rf}_{\mathrm{UD}}-\mathrm{Rf}_{\mathrm{MF}}\right)+\frac{\mathrm{Ph}\left(\mathrm{C}_{\mathrm{UD}} \cdot \mathrm{C}_{\mathrm{MF}}\right)(\mathrm{Wr})(\mathrm{X})}{\mathrm{Br}^{\mathrm{Br}}}+$
$\mathrm{Wh}\left(\mathrm{C}_{\mathrm{UD}}-\mathrm{C}_{\mathrm{MF}}\right)(\mathrm{Wr})+\left(\mathrm{Bt}_{\mathrm{UD}}-\mathrm{Bt}_{\mathrm{MF}}\right)(\mathrm{X})-\mathrm{A}_{\mathrm{UD}}$
$(X)=0$
Where UD = universal density bale press.
MF $=$ modified flat bale press.
$\mathrm{X}=$ breakeven volume .
Pct = combined percentage rate ( 13.5 percent) for calculating annual fixed costs, composed of depreciation ( 7 percent), taxes ( 2 percent), insurance ( 0.5 percent), and interest of 8 percent on half of total investment.
$\mathrm{I}=$ investment requirement for each type of bale press (see table 18).
$\mathrm{Br}=$ actual average seasonal processing rate in bales per hour- $8,12,16,20$, and 24 considered in this article.
P $\quad=$ power cost per bale by press type- 11 cents for UD presses and 2 cents for MF presses.
$\mathrm{Rv}=$ variable repair and supply costs per bale by press type-5 cents for UD presses and 3 cents for MF presses.
$\mathrm{Rf}=$ fixed annual repair and supply cost per bale by press type- $\$ 500$ for UD presses and $\$ 250$ for MF presses.
$\mathrm{Ph}=$ percentage of hours press crew paid compared to operating hours at rate " Br " when seed cotton is available-110 percent for both press types.
C $=$ press crew size by press type (see table 19).
$\mathrm{Wr}=$ hourly wage rate for press crew-\$3.40 including fringe expenses.
$\mathrm{Wh}=$ annual hours press crew is on duty and paid while press is idle-estimated at 250 hours per season for both press types and all processing rates.

Table 19-A verage press crew requirements by press type and processing rate

| Ginning and <br> baling rate | Press crew requirements |  |
| :---: | :---: | :---: |
|  | Universal <br> density | Modified <br> flat |
| Bales per nour | Number of employees ${ }^{1}$ |  |
| 8 | $1 \frac{1}{2}$ | 3 |
| 12 | 2 | 4 |
| 16 | $2 \frac{1}{2}$ | 3 |

[^6]Bt $=$ bagging and tie cost per bale by press type$\$ 3.75$ per UD and $\$ 4.75$ per MF bale.
$\mathrm{A}_{\mathrm{UD}}=$ per bale allowance for gin UD bale paid to ginner by warehouse or compress-0 to $\$ 3.00$ per UD bale.
For example, using these values and rates taken from actual ginning records, the breakeven volume between new presses of the two types for a 16 bale per hour gin can be calculated as follows:

$$
\begin{aligned}
& \text { 1.- } 0.135(\$ 265,000-\$ 95,000)+(\$ 0.11-\$ 0.02)(\mathrm{X})+ \\
& (\$ 0.05-\$ 0.03)(\mathrm{X})+(\$ 500-\$ 250)+ \\
& \frac{1.1(2.5-4.5)(\$ 3.40)(\mathrm{X})+250(2.5-4.5)(\$ 3.40)+}{16} \\
& (\$ 3.75-\$ 4.75)(\mathrm{X})-\$ 3.00(\mathrm{X})=0 \\
& 2 .-\$ 22,950+\$ 0.09(\mathrm{X})+\$ 0.02(\mathrm{X})+\$ 250-\$ 0.4675 \\
& (\mathrm{X})-\$ 1,700-\$ 1.00(\mathrm{X})-\$ 3.00(\mathrm{X})=0 \\
& \text { 3.- } \$ 21,500-\$ 4.3575(\mathrm{X})=0 \\
& \mathrm{X}=4,934 \text { bales (breakeven volume) }
\end{aligned}
$$

Table 18-Installed costs of universal density and new modified flat bale presses, by size group, 1975

Based on average cost and operating relationships of actual cotton gins.
introducing several allowance rates for UD compression and holding all other variables constant. However, changes in crew requirements, wage rates, bagging and tie costs or investment cost can readily be inserted in the equation and a new set of breakeven volumes developed.

## REPLACING AN EXISTING MODIFIED FLAT BALE PRESS

A gin owner considering the installation of a new UD press in place of an existing MF bale press which could be used for several more years also needs to know the breakeven or indifference volume for his plant.

Investments in existing MF bale presses vary appreciably from plant to plant. Investment costs used to calculate breakeven volumes for these plants typify those costs commonly incurred in installing a new flat bale press in the early 1960's and modified in 1973. Combined, these costs were $\$ 25,000$ for a MF bale press with a capacity of up to 15 bales per hour, and $\$ 30,000$ for one with a capacity of $16-24$ bales per hour. With other cost relationships and assumptions remaining the same, breakeven volumes between the two types of presses for various UD compression allowances were computed and are shown in table 21.

Based on the current UD compression allowance ( $\$ 3.00$ per bale), breakeven volumes ranged from 5,657 bales in 8 -bale per hour gins to 7,205 bales in the 24 -bale per hour gins. Substantial increases in breakeven volumes occur as the compression allowance decreases.

Breakeven volumes when replacing an existing MF bale press that could be used for several more years with

Table 21-Breakeven volumes for replacement of an existing press at different allowance rates, by gin plant size

| Universal density compression allowance | Gin plant size (bales per hour) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 8 | 12 | 16 | 20 | 24 |
| Per bale | Bales | Bales | Bales | Bales | Bales |
| None | 16,323 | 16,884 | 22,302 | 23,952 | 25,193 |
| \$1.00 | 10,024 | 10,166 | 12,842 | 13,372 | 13,751 |
| \$1.50 | 8,403 | 8,479 | 10,595 | 10,953 | 11,206 |
| \$2.00 | 7,233 | 7,272 | 9,017 | 9,275 | 9,456 |
| \$2.50 | 6,349 | 6,366 | 7,848 | 8,043 | 8,179 |
| \$3.00 | 5,657 | 5,636 | 6,948 | 7,100 | 7,205 |

Based on average cost and operating relationships of actual cotton gins.
a new UD press, are about 45 percent higher for the 8 and 12 bale per hour plants and 41 percent higher for the 16 to 24 bale per hour plants than the volumes required for new MF bale presses compared to new UD presses. Breakeven volumes are higher because the investment and related fixed costs of the existing flat bale press are considerably lower than the costs of a new flat bale press.

## IMPLICATIONS

Results show that the installation of UD presses rather than MF bale presses when erecting new gins appears to be justified with projected annual volume of over 3,850 bales in the 8 and 12 bale per hour gins and over 5,000 bales for the 16,20 , and 24 bale per hour plants. However, any significant decrease in the compression allowance results in a significant increase in breakeven levels required. Moreover, when erecting a new facility, a larger size gin than is actually needed should not be constructed just because volume levels would also justify UD compression.

Replacement of an existing MF bale press which could be used several more years with a new UD press appears to be justified in 16,20 , and 24 -bale per hour gins with projected annual volumes of over 6,948 bales. These findings further indicate that these volumes are even lower for 8 and 12 -bale per hour plants. Based on the capacities and volumes of the U.S. ginning industry, a sizeable expansion in the use of UD presses appears feasible from an economic standpoint. However, costs of new UD presses are likely to be higher in the future than those on which the findings of this study are based. Costs of bagging and ties, labor, power, and other basic inputs are also rising. Changes in the relative cost differences between these two types of presses will also have an impact on breakeven levels.

"M-1-1/16" at Group B MIII points, net weight. ${ }^{2} 1.5$ and 3.0 denier, regular rayon staple. ${ }^{3}$ Reported average market price for 1.5 denler polyester staple for cotton blending. ${ }^{4}$ Actual prices converted to estimated raw fiber equivalent as follows; cotton, divided by 0.90 rayon and polyester, divided by 0.96 .

Agricultural Marketing Service and Trade reports.

Table 29-U.S. consumption of fibers: Total and per capita

[^11]Table 30-Manmade fiber equivalent of U.S. imports for consumption of manmade fiber manufactures

${ }^{1}$ Not included in these data are quantities of imported textured non-cellulosic singles yarn not over 20 turns per inch. In terms of thousands of pounds, the quantities of such yarn are: (1) Valued not over $\$ 1$ /pound; 1976, February 4,214 (2) Valued over $\$ 1$ /pound; 1976, February 3,127. ${ }^{2}$ Includes gloves, hosiery, underwear, outerwear, and hats. ${ }^{3}$ Includes veils and vellings, nets and nettings, lace window curtains, edgings, insertings,
flouncings, allovers, etc., embroideries, and ornamented wearing apparel. ${ }^{4}$ Includes braids (except hat braids), fabrics with fast edges not over 12 inches wide, garters, suspenders, braces, tubings, cords, tassels, gill nets, webs, seines, and other nets forb fishing. ${ }^{5}$ Not elsewhere classified. ${ }^{6}$ Preliminary.

Compiled from reports of the Bureau of the Census.

Washington, D.C. 20250

[^0]:    ${ }^{1}$ Currently represents American-Pima cotton; earlier years included Sea island and Sealand. ${ }^{2}$ Less than 500 bales, ${ }^{3}$ Includes cotton from 1974 and 1975 crops.

[^1]:    'Cotton broadwoven fabrics. ${ }^{2}$ Polyester blends with cotton. Based on data from American Textile Manufacturers Institute ${ }^{3}$ Unadjusted. ${ }^{4}$ End of month. and the Bureau of the Census.

[^2]:    ${ }^{1}$ Numbers in parentheses indicate number of weeks in period. ${ }^{2}$ Preliminary.

[^3]:    * C.I.f. NORTHERN EUROPE.

[^4]:    ${ }^{1}$ Includes fabrics, tire cord and cloth for export to the Philippines to be embroidered and otherwise manufactured and returned to the United States. ${ }^{2}$ Includes tapestry and upholstery fabrics, table damask, pile fabrics and remnants. ${ }^{3}$ Includes curtains and draperies, house furnishings not elsewhere specified. ${ }^{4}$ Includes gloves and mits of woven fabric. ${ }^{5}$ Includes underwear and outerwear of woven fabric, handkerchiefs, and wearing apparel containing mixed fibers (corsets, brassieres, and girdles,

[^5]:    'This article is based on results of a comprehensive study of baling cotton at gins. The complete analysis is currently being cleared for publication by the Economic Research Service.

[^6]:    ${ }^{1}$ Fractional number of employees assumes assignment to other tasks not allocated to pressing operation.

    Based on actual observations at gins equipped with universal density presses using automatic strapping on naked bales with a conveyor sacking system, and at conventional modified flat presses using manual strapping and jute bagging.

[^7]:    ${ }^{1}$ Numbers in parentheses indicate number of weeks in month. ${ }^{2}$ Totals made from unrounded data. ${ }^{3}$ Includes data for which breakdown by staple length was not obtained. ${ }^{4}$ Running bales. ${ }^{5}$ Preliminary.

[^8]:    ${ }^{1}$ Preliminary. ${ }^{2}$ Carryover at beginning of season, plus ginnings. ${ }^{3}$ Supply minus carryover end of season.

[^9]:    ${ }^{1}$ Spot market loan rates and prices are for cotton with micronaire readings of 3.5 through 4.9. ${ }^{2}$ Excludes domestic allotment payments, price support and diversion payments. ${ }^{3}$ Welghted average. "Midding 1 ", average location. ${ }^{5}$ SLM 1-1/16" average location. "Average price to January 1, 1976
    with no allowance for unredeemed loans.
    Agricultural Stabilization and Conservation Service, Agricultural Marketing Service, and Statistical Reporting Service.

[^10]:    ${ }^{1}$ Preliminary. ${ }^{2} 480$-pound net weight. ${ }^{3}$ Difference between sum of estimated raw cotton consumption in itemized products and reported total mill consumption. Reflects cotton consumption in minor uses, such as tire cord, as well as inventory changes and lags between raw cotton consumption and production of textile products.

    Based on data reported in Current Industrial Reports, Department of Commerce, Bureau of the Census, and Cotton Counts its Customers, National Cotton Council of America.

[^11]:    ${ }^{1}$ Including Armed Forces overseas, Alaska and Hawaii. ${ }^{2}$ Total consumption divided by population. ${ }^{3}$ ' Mill " consumption of cotton is the net weight of running bales. Wool data include apparel and carpet wool scoured basis. Rayon and acetate data and non-cellulosic manmade fiber data (including glass) are producers' shipments plus imports for consumption. Manmade fibers waste
    data are producers" waste consumed by mills (excluding glass). Flax and silk data are imports for consumption. "Domestic" consumption refers to mill consumption adjusted for raw fiber equivalent of net U.S. trade in textile manufactures. Rayon and acetate data and non-cellulosic manmade fiber data includes fiber
    waste. "All fibers" data exclude flax and silk. ${ }^{5}$ Less than 0.05 pound. ${ }^{6}$ Preliminary.

    Manmade fibers, Textife Organon, a publication of the Textile Economics Bureau, Inc.; all other, Bureau of the Census reports.

[^12]:    ${ }^{1}$ Excludes preseason ginnings. ${ }^{2}$ Totals may not add due to rounding. ${ }^{3}$ Includes cotton destroyed and unaccounted for. ${ }^{4}$ Bales of 480 -pound net. ${ }^{5}$ Less than 50,000 bales. ${ }^{6}$ Preliminary. ${ }^{7}$ Estimated.
    *Foreign data as of April 1, 1976.

[^13]:    ${ }^{5}$ Includes American-Pima cotton.

[^14]:    Compiled from reports of the Bureau of the Census.

[^15]:    ${ }^{1}$ Preliminary. ${ }^{2}$ Includes noils, reprocessed and reused wool, mohair, alpaca, vicuna, and other specialty hair fibers as well as cotton, jute, and other vegetable fibers.

    Compiled from reports of the Bureau of the Census.

[^16]:    ${ }^{1}$ Beginning January 1976 the unit designation terminology for wool prices changed to microns; for example, Fine good french combing and staple now reads as (64's (20.60-22.04 MICRONS) Staple 2-3/4'' and up and French combing 2-1/4'' $-2-3 / 4^{\prime \prime}$.

[^17]:    ${ }^{1}$ includes manufactures of mohair, alpaca, and other wool-like specialty hair. ${ }^{2}$ includes pile fabric and manufactures, tapestry and upholstery goods, press and billiard cloths. ${ }^{\frac{3}{3}}$ Includes carrlage and automobile robes, steamer rugs, etc. ${ }^{4}$ Includes laces, lace articles, veils and veilings, nets and nettings, when reported in pounds. ${ }^{5}$ Includes knit fabrics in the piece and miscellaneous
